Previously only found between the pages of super hero comic books or mansions in elite suburbs, residential basement parking is now a reality and has just become more accessible. Traditional car hoists to date have allowed parking of an extra car above another in a garage, but depending on the building structure, this is not always possible.

The latest in large scissor lifts, from car hoist specialist Tufflift, is the future in residential multi-car parking – not above, but below.

When building a new home or renovating an existing one, making provision for parking has increasingly become a logistical challenge for architects and builders. Whether you need space for one car or six, the planning to incorporate the access to a basement car park has previously been restricted to a large inclined ramp being constructed from the street to the underground car park - although functional, it does create a number of issues.

A ramp to the side of a property requires the significant expense of excavation, foundations, retaining walls and drainage, along with using up valuable land in the process. Some existing properties are built to the fence line, so access to a basement car park would not be possible unless the house is set back away from the street with front access. These solutions might be practical, but sacrifices a landscaped front garden and is not always aesthetically pleasing to the owners or neighbourhood.

Tufflift now offers a large drive-on scissor lift for cars, which is built into the floor of a traditional car garage. With basement parking under the garage or house, the S-VRC elevates cars to and from the basement with ease, with the added benefit of retaining car parking at street level within the garage.

The S-VRC is custom designed by Tufflift, who consults with architects and helps manage the individual project with the builder from design to installation. With a multitude of applications, it is also ideal for sloping on uneven blocks. Providing the facilities of multiple car parking to any property today will give an automatic return on the investment.

Now you can have secure, discreet basement parking with access through your garage to store a classic, collectible or any other car along with motorcycles or water craft.

Tufflift pride themselves on their quality product range and customer service to ensure you choose the right hoist for your space. With over 60 years combined experience in sales, installation and service, the team has extensive industry knowledge to help design the optimum space usage in your construction. They can recommend which hoist is going to best service your needs in the space you have.

The range that Tufflift carries isn't just restricted to these new scissor lifts, depending on your need, there are two and four post car hoists for both storage and workshops to maintain cars.
